

# Congestion Management at PJM ISO

---

Mehmet Kemal Celik  
mkcelik@nexant.com  
Product Manager  
Nexant, Inc.  
October, 2002

# PJM Energy Market

---

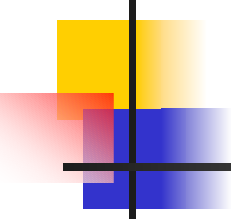

- Pricing system is based on locational marginal pricing (LMP)
- LMP's reflect the marginal cost of supplying the next increment of electricity demand
- LMPs include opportunity cost of using the transmission system during congestion
- Participants pay congestion cost based on day-ahead market LMPs

# Hedging for Congestion

---

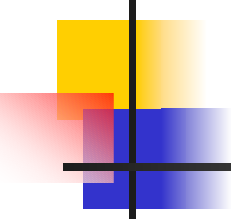

- During congestion
  - Generation resources are dispatched out of economic merit order to control the the flow(s) on the congested facility(ies)
  - LMP spread can be significantly different
- Operating conditions & congestion are unknown until the last minute
- Financial Transmission Rights (FTR) provide a mechanism for hedging against congestion costs

# Financial Transmission Right (FTR)

---

- An FTR is defined from a point of receipt to a point of delivery
- FTRs can be designated to and from any single bus, hub, zone, aggregate or interface bus for which LMP values are calculated
- Economic value of an FTR is determined by
  - By the difference in the hourly LMP (day-ahead) values at its source and sink
  - By its MW reservation
  - Is independent of the actual energy delivery (thus, the terminology "Financial")

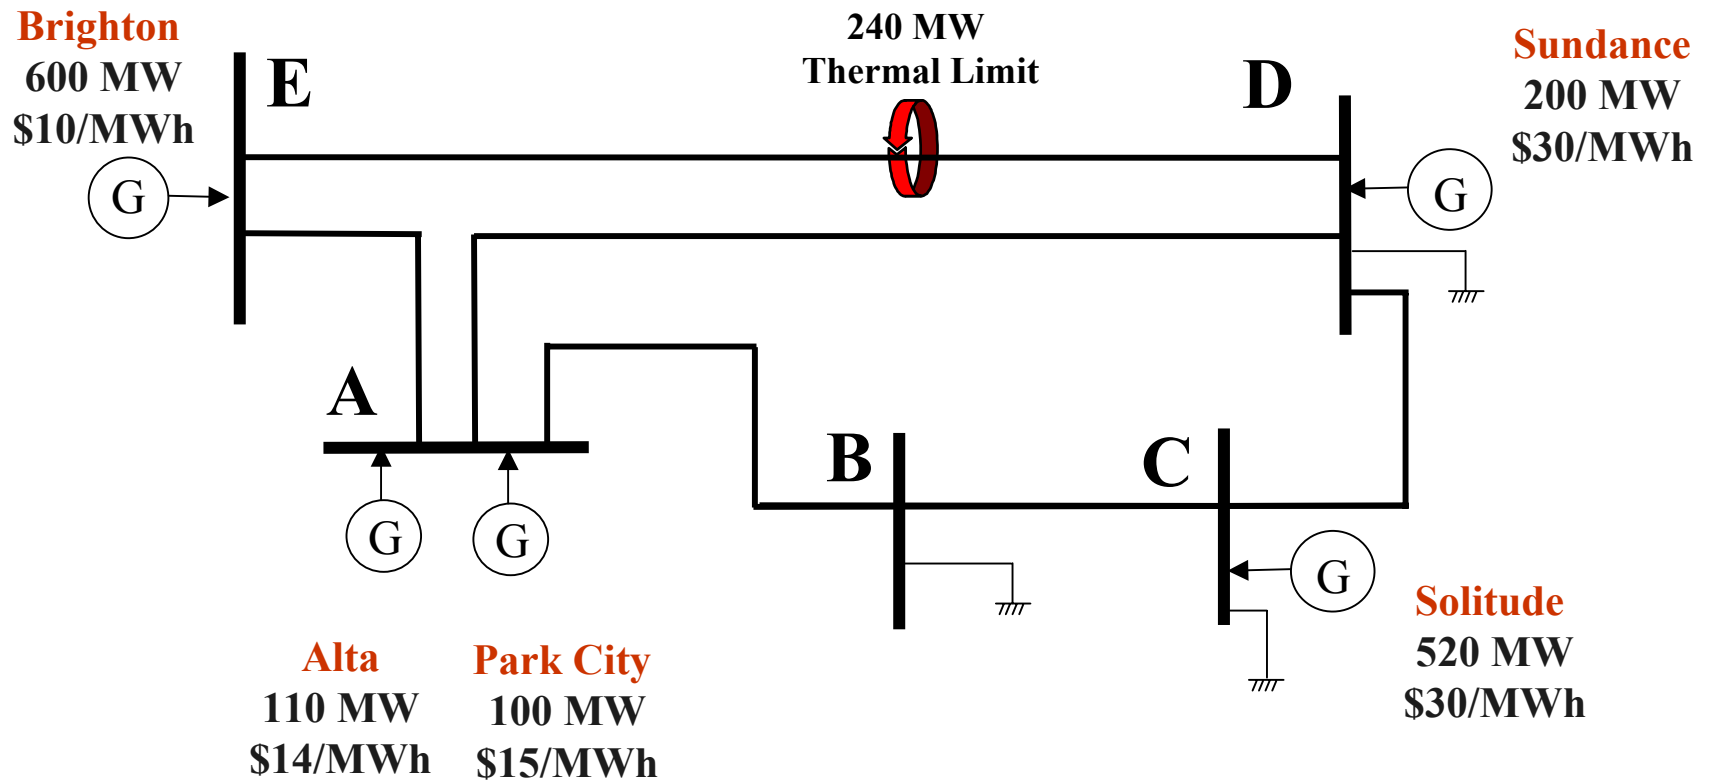

# Financial Transmission Right (FTR)

---

- An FTR (in PJM's current FTR Auction System)
  - can be a benefit (credit if in the direction of the congestion)
  - can be a liability (debit if in the opposite direction of the congestion)
- FTRs at PJM ISO can be (currently) acquired by
  - Network Integration Transmission Service
  - Firm Point-to-Point Service
  - Monthly FTR Auction
  - Secondary Market

# 5 Bus Example

From PJM FTR Auction Training Guide

# Annual Commitments

| Participant        | Generation (MW)                    | Load (MW)                             | Fixed FTRs    |             |             |
|--------------------|------------------------------------|---------------------------------------|---------------|-------------|-------------|

# FTRs as a Hedging Mechanism

| FTR Info \ Cases   | 1        | 2 (with different FTR holding)           |            |          |
|--------------------|----------|--|------------|----------|
|                    |          | 0 MW                                     | 200 MW     | 300 MW   |
| Transaction        | 223 MW   | 300 MW                                   |            |          |
| LMP Difference     | 0. \$/MW | 10.70 \$/MW (= 21.14 \$/MW – 10.44\$/MW) |            |          |
| Generation Payment | \$ 3122  | \$ 3132 (= 300 MWh * 10.44 \$/MWh)       |            |          |
| Load Charge        | \$ 3122  | \$ 6342 (= 300 MWh * 21.14 \$/MWh)       |            |          |
| Congestion Cost    | \$ 0.    | \$ 3210 (= 300 MWh * 10.70 \$/MWh)       |            |          |
| FTR Credit         | N/A      | \$ 0.                                    | \$ 2140.   | \$ 3210. |
| Final Balance      | \$ 0.    | (\$ 3210.)                               | (\$ 1070.) | \$ 0.    |

# Monthly Auction Timeline

---

- 2 weeks prior to start of auction month
  - FTR requests for network source changes are suspended
  - Estimates of residual FTRs are posted
  - Participants start submitting bids
- 1 week prior to start of auction month
  - Auction closes
- Within 2 business days
  - PJM carries out the auction and posts results
- Beginning of auction month
  - Suspended FTR change requests start being processed

# FTR Auction Solution

---

- Power flow
  - DC solution (losses are ignored)
  - PARs for regulating MW flow
- Contingency analysis
  - Using contingency ratings
- Simultaneous Feasibility Test
  - Enforcing the normal and contingency constraints (normal branch and post-contingency branch and interface ratings)
  - Ensuring the auction is revenue adequate
- Optimization
  - Security constrained optimization problem
  - Objective function maximizes the revenue

# Monthly FTR Auction Example

| Bid Number & Type | Amount (MW) | Price (\$/MW) | Source Number | Sink Number |
|-------------------|-------------|---------------|---------------|-------------|
| <b>Buy</b>        | 40          | 5.00          | A             | D           |
| <b>Buy</b>        | 10          | 4.00          | E             | B           |
| Buy               | 10          | 4.00          | A             | D           |
| Buy               | 10          | 4.00          | E             | C           |
| <b>Sell</b>       | 10          | 2.00          | E             | C           |
| Sell              | 10          | 6.00          | A             | D           |

# Auction Results

| Bid Number & Type | Amount (MW) | Price (\$/MW) | Source Number/LMP | Sink Number/LMP | Clearing Price LMP $\Delta$ | Cleared FTR (MW) |
|-------------------|-------------|---------------|-------------------|-----------------|-----------------------------|------------------|
| <b>Buy</b>        | 40          | 5.00          | A/ \$1.52/MW      | D / \$6.52/MW   | \$5.00/MW                   | <b>28.1</b>      |
| <b>Buy</b>        | 10          | 4.00          | E/ \$0.00/MW      | B/ \$ 3.57/MW   | \$3.57/MW                   | <b>10.0</b>      |
| Buy               | 10          | 4.00          | A/ \$1.52/MW      | D / \$6.52/MW   | \$5.00/MW                   | 0.0              |
| Buy               | 10          | 4.00          | E/ \$0.00/MW      | C/ \$4.35/MW    | \$4.35/MW                   | 0.0              |
| <b>Sell</b>       | 10          | 2.00          | E/ \$0.00/MW      | C/ \$4.35/MW    | \$4.35/MW                   | <b>10.0</b>      |
| Sell              | 10          | 6.00          | A/ \$1.52/MW      | D / \$6.52/MW   | \$5.00/MW                   | 0.0              |

# Analysis of Output

| Bid Number & Type | Amount (MW) | Price (\$/MW) | Source Number/LMP | Sink Number/LMP | Clearing Price LMP $\Delta$ | Cleared FTR (MW) |
|-------------------|-------------|---------------|-------------------|-----------------|-----------------------------|------------------|
| Buy               | 40          | 5.00          | A/ \$1.52/MW      | D / \$6.52/MW   | \$5.00/MW                   | 28.1             |
| Buy               | 10          | 4.00          | E/ \$0.00/MW      | B/ \$ 3.57/MW   | \$3.57/MW                   | 10.0             |
| Buy               | 10          | 4.00          | A/ \$1.52/MW      | D / \$6.52/MW   | \$5.00/MW                   | 0.0              |

- **Marginal FTR BID** (Amount Paid = \$140.5 = 28.1 \* 5.0)
- Questions :
  - Was there a bid price at which we could get all the MW we bid for?
  - How much could we reduce the bid price and retain the same amount of MW?
- For analysis :
  - Vary the bid price and re-run the auction

# Analysis of Output

| Bid Number & Type | Amount (MW) | Price (\$/MW) | Source Number/LMP   | Sink Number/LMP      | Clearing Price LMP $\Delta$ | Cleared FTR (MW) |
|-------------------|-------------|---------------|---------------------|----------------------|-----------------------------|------------------|
| Buy               | 40          | 5.00          | A/ \$1.52/MW        | D / \$6.52/MW        | \$5.00/MW                   | 28.1             |
| <b>Buy</b>        | <b>10</b>   | <b>4.00</b>   | <b>E/ \$0.00/MW</b> | <b>B/ \$ 3.57/MW</b> | <b>\$3.57/MW</b>            | <b>10.0</b>      |
| Buy               | 10          | 4.00          | A/ \$1.52/MW        | D / \$6.52/MW        | \$5.00/MW                   | 0.0              |
| Buy               | 10          | 4.00          | E/ \$0.00/MW        | C/ \$4.35/MW         | \$4.35/MW                   | 0.0              |

- **Successful FTR Bid** (Amount Paid = \$35.7 = 10. \* 3.57)
- Questions :
  - How much more MWs could we bought at the same clearing price?
- For analysis :
  - Set the bid price to clearing price, the MW amount to a large value and re-run the auction

# Analysis of Output

---

- Identifying attractive paths with low market activity
  - Compare the marginal prices of all injections and withdrawals
- Identifying constraints that have the largest impact upon the prices
  - Locational marginal price breakdown by congested facilities
- Analysis of unsuccessful bids
  - How much more should we have bid?

# Nexant's GridSmart

---

- Analytical tools via the Internet
  - Load Forecasting tool (All major ISO Regions)
  - FTR Tool (Simulation Tool for PJM's FTR Auction )
- Powered by well-proven technologies
  - Extensive energy industry expertise world-wide
  - Proprietary software used by ISOs and utilities
- ASP model
  - Managed data collection, cleansing and maintenance
  - Centralized hosting & management
  - Tool, functionality and technology update
  - Elimination of expensive in-house expertise

# Nexant's GridSmart

---

- Input data that require real-time and/or frequent updates
- Comprehensive and consistent data
- Preparation of large amount of data of different origin, format, etc.
- Fast and smart what-if analysis
- Output analysis and hand-holding by engineers and/or consultants

# Next Generation FTR Auction System @ PJM

---

- Two types of FTRs
  - Obligation (as it exists today)
  - Options - Its hourly economic value is zero when the designated path is in the direction opposite to the congested flow
- New mechanism for acquiring FTRs
  - Annual auction
  - Monthly auction
  - Second market

# Next Generation FTR Auction System @ PJM

---

- New mechanisms for awarding FTRs
  - Multi-period : multiple base-cases across a single optimization timeframe
    - 24 Hour, on-peak, off-peak
    - separate time intervals - summer, winter
  - Multi-round (4 rounds)
    - 25% of the feasible FTR capability of the PJM system will be awarded
- Auction Revenue Rights (ARRs): the mechanism to distribute the proceeds of the Annual FTR Auction to Load Serving Entities and to Firm Transmission customers
